

# Newsticker

## Create a new ticker

Ticker articles are normal articles. To create a newsticker, it is necessary to create a new post and check the box "Enable newsticker" in the "Newsticker" metabox in the right sidebar.

**Newsticker** ▲

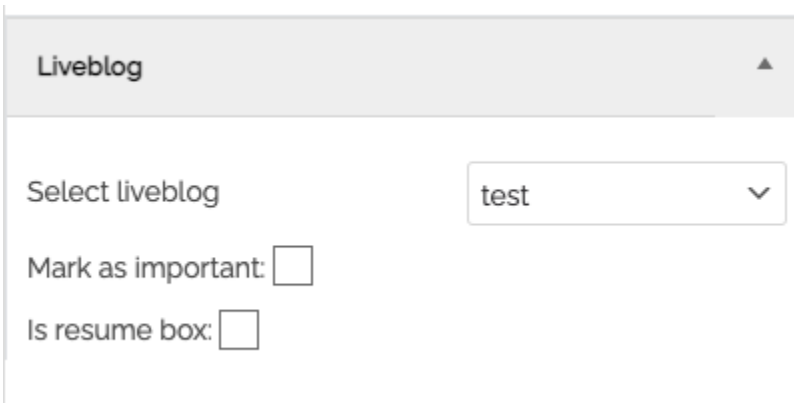

☒ Enable newsticker

Status  ▼

## Add items to the ticker

To add content to the ticker, it is necessary to create newsticker items by clicking "Newsticker" in the left dashboard sidebar Add New. Then you can create a new item for the newsticker and fill it with content like for every other post.

In the sidebar the assigned liveblog can be selected and the post can be marked as important or as a resume box:

**Liveblog** ▲

Select liveblog  ▼

Mark as important: ☐

Is resume box: ☐

## Properties in the CatalogAPI

The liveblog itself can be recognized by the property "isNewsticker". In case this is set to true, the article is enabled as a liveblog.

The items on the other hand have a property "newsticker" with the ID of the assigned liveblog as value. They also have the properties "newstickerIsImportant" and "newstickerIsResume" which correspond to the checkboxes in the article.

- To search for the created newstickers use [this](#) query. There you should find the newsticker you created before
- To search for the newsticker items, use [this](#) query and search for the newsticker items (there should be a property "newsticker" with an ID as a value)
